ATTENDANCE SYSTEM

Project Handover & Setup Guide

Attendance Management System

A clean, production-ready web app for employees to register, mark daily attendance, and for admins to see exactly who's present — built on Next.js & Supabase.

Prepared for

Evolut Ecommerce Solutions

Stack

Next.js 14 · Supabase

Status

Built & build-verified

1 What was built

A full-stack attendance platform with two role-based experiences — **Employee** and **Admin** — secured end-to-end by database row-level security. Employees self-register with complete verified details and a photo, then check in / out each day. Admins get live visibility of attendance across the whole team.

Employee experience

Self-registration with full profile, one-tap check-in / check-out, and personal attendance history.

Admin experience

Live “who's present today” dashboard, team-wide stats, and a searchable employee directory.

Key features

- ✓ **Employee self-registration** — full name, work email, password, **CNIC** (format-validated), **phone**, **address**, department, position, and **profile photo upload**.
- ✓ **One-tap check-in / check-out** with automatic *Late* detection (after 09:30 PKT).
- ✓ **Personal dashboard** — today's status, profile card, and a 14-day attendance history.
- ✓ **Admin overview** — live counts (Present / Late / Not-in) and a real-time table of who is in today.
- ✓ **Employee directory** — profile cards with full details and per-employee 30-day attendance history.
- ✓ **Role-based access** — employees see only their own data; admins see everyone (enforced by Postgres Row-Level Security).
- ✓ **Clean, responsive UI** in the Evolut navy brand palette, with the company logo.

2 Technology stack

LAYER	TECHNOLOGY	WHY
Framework	Next.js 14 (App Router, TypeScript)	Fast, SEO-friendly, deploys in one click to Vercel
Styling	Tailwind CSS	Clean, consistent, responsive UI
Auth	Supabase Auth	Secure email/password sign-in, managed for you
Database	Supabase Postgres	Reliable SQL with Row-Level Security
File storage	Supabase Storage	Holds employee profile photos
Hosting	Vercel (recommended)	Zero-config Next.js deployment

3 Pages & structure

ROUTE	WHO	PURPOSE
/register	Employee	Full sign-up form incl. CNIC, phone, address, photo
/login	All	Sign in
/dashboard	Employee	Check-in / out, profile, personal history
/admin	Admin	Live overview — who's present today + stats
/admin/employees	Admin	Directory of all employees
/admin/employees/[id]	Admin	One employee's full profile & attendance

```
// project layout
src/
  app/
    (auth)/login, (auth)/register // branded auth screens
    dashboard/                   // employee: check-in/out + history
    admin/                       // admin overview + employee directory
    api/register/                // server-side account + photo + profile creation
  components/                   // Logo, Avatar, header, badges, cards
  lib/supabase/                 // browser / server / middleware clients
supabase/schema.sql             // run once in Supabase
```

4 How to set it up

Everything is installed and the production build is verified. The only thing left is connecting your own Supabase project (about 5 minutes).

1 Create a Supabase project

Go to supabase.com → **New project**. When ready, open **Project Settings** → **API** and copy the **Project URL**, the **anon** public key, and the **service_role** key.

2 Run the database schema

In Supabase, open **SQL Editor** → **New query**, paste the entire contents of `supabase/schema.sql`, and click **Run**. This creates the tables, the photo storage bucket, and all security policies.

3 Add your environment keys

Copy the example file and fill in the four values:

```
cp .env.local.example .env.local

NEXT_PUBLIC_SUPABASE_URL=https://YOUR-ref.supabase.co
NEXT_PUBLIC_SUPABASE_ANON_KEY=...
```

```
SUPABASE_SERVICE_ROLE_KEY=...  
NEXT_PUBLIC_BOOTSTRAP_ADMIN_EMAIL=admin@evolutecomsolutions.com
```

4 Run the app

```
npm install  
npm run dev
```

Open **http://localhost:3000**.

5 First login

Register first using the email you set in `BOOTSTRAP_ADMIN_EMAIL` — that account automatically becomes the **Admin**. Everyone else who registers is an **Employee**.

Make someone an admin later: run this in the Supabase SQL Editor —
`update public.profiles set role = 'ADMIN' where email = 'name@evolutecomsolutions.com';`

5 Deploying to production

1 Push to Git

Push this project to a GitHub / GitLab repository.

2 Import to Vercel

At **vercel.com/new**, import the repo. No build settings needed — it's a standard Next.js app.

3 Add the same 4 environment variables

In **Vercel** → **Project** → **Settings** → **Environment Variables**, then deploy.

6 Good to know

- ✓ Times use **Pakistan Standard Time (UTC+5)**; the "late" cutoff (09:30) is a one-line change in `src/app/dashboard/actions.ts`.
- ✓ Account creation and photo uploads run **server-side** with the service-role key — the secret key is never exposed to the browser.
- ✓ Next.js is pinned to the **security-patched 14.2.35** release.
- ✓ The one thing that requires your account is creating the Supabase project — everything else is done and compiling.
